Aditya Group CRM

Manual Role, Department and Notification Test Report

Generated 14/9/2026

Executive Summary

The requested Admin Login History restriction was implemented and validated by TypeScript. The full human/API run could not complete because the configured PostgreSQL connection rejected TLS credentials. This report separates verified code checks from environment-blocked tests and does not mark blocked flows as passed.

Release status

BLOCKED FOR FULL E2E SIGN-OFF

The application still needs a working database TLS configuration and a running server before real user creation, lead lifecycle, browser notification, push notification, and manual mobile/desktop checks can be completed.

Test Results

Verified checks and blocked checks from this run.

PASS

Admin Login History hidden in navigation

Removed from Admin navigation and direct route fallback now returns Dashboard.

PASS

Admin Login History API authorization

API now permits only Super Admin and returns 403 for other roles.

PASS

TypeScript validation

npx tsc --noEmit completed without errors.

BLOCKED

ESLint validation

The installed eslint-config-next entry could not be resolved by ESLint 9 in this environment.

BLOCKED

Production build

next build started but produced no progress and was stopped after hanging in the local environment.

BLOCKED

Role user creation and cleanup

Database test stopped before user creation because PostgreSQL TLS failed: no credentials available in the security package.

BLOCKED

OTP and authenticated API flow

Requires the same unavailable PostgreSQL connection and a running application server.

BLOCKED

Push notification delivery

Requires a running server, working database, browser permission, and VAPID keys. No VAPID keys are configured in the active .env.

BLOCKED

Manual desktop/mobile browser flow

No application server was available after the database environment failed; no browser result is claimed.

Role and Dashboard Test Map

Tabs to verify manually after the database and server are available.

Super Admin	Dashboard, Leads, Models, Users, Reports, Performance, Login History, Recycle Bin, Theme, Backup & Restore
Admin	Dashboard, Leads, Reports, Performance, Recycle Bin
Data Operator 1	Dashboard, Leads, Add Entry, Reports
Data Operator 2	Dashboard, Leads, Add Entry, Reports
Department User	Dashboard, Leads

Role test actions

- Super Admin: create one temporary user for every role, verify every tab, then recycle and permanently remove the temporary users.
- Admin: verify Login History is absent from the sidebar, direct route, and API response.
- Data Operators: create a lead, assign it to a department user, edit only their own created lead, and verify reports are scoped.
- Department User: open the assigned lead and submit required status, remark, and next follow-up update.
- All roles: verify dealer isolation, department isolation, search scope, notifications, and responsive tables.

Department Test Matrix

Each department must be tested through assignment, update, notification, and reporting.

Sales (Personal)	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Sales (Commercial)	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Service	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Spare Parts	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Accessories	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Finance	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Insurance	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Bodyshop	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Used Manager / Used Car	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification
Emergency Breakdown	Lead assignment -> department form -> required status -> remark/follow-up -> notification -> dashboard/report verification

Notification and Push Test Plan

Expected two-way behavior for the next environment-enabled run.

Assignment	Assigned user, Admin, and Super Admin receive an alert. The actor does not receive a duplicate self-alert.
Status update	Managing Data Operator, Admin, and Super Admin receive the status change.
Remark	Managing Data Operator, Admin, and Super Admin receive the remark details.
Cross-tab	A second open CRM tab receives the notification and updates its title with the unread count.
Browser push	Allow permission, subscribe with VAPID keys, send an event, verify notification while another tab is active or the CRM tab is hidden.
